

1) Start up new database

It might be better to do:

`initdb data`

`pg_ctl -D data -l logfile start`

4) Add Assets

Doesn't print out asset description when asset is created

5) Transfer Asset

Got a "Internal Server Error" when I tried to generate the asset transfer

I manually inserted an item into the requests table. However, didn't appear in Approve Request page.

6) Dispose Asset

Updated `depart_dt` not `disposed_dt`

7) Asset Display

When I clicked the display button "Bad Request" popped up.

Overall, the UI looks great and the user instructions were very helpful and clear. Besides the problems I mentioned above everything ran smoothly. Good job.
